1. Overview

Reliability testing of microelectronic products is a risk mitigation process designed to ensure the service life of device in customer applications. Semiconductor wafer manufacturing process and package-level reliability can be assessed in a variety of ways and may include accelerated environmental test conditions. Chipanalog evaluates manufacturability of the device to verify a robust silicon and assembly flow to ensure continuity of supply to customers. Chipanalog qualifies new devices, significant changes, and product families based on JEDEC JESD47. CA-IS305XCX series chips are packaged with the same wafer. The differences between part numbers are the package and bonding diagram. The data shown is representative of the material sets, processes, and manufacturing sites used by the device family.

2. Part Number List

Package Type	**Part Number**
DUB8(U)	CA-IS3050CU
SOIC8-WB(G)	CA-IS3050CG/CA-IS3052CG
SOIC16-WB(W)	CA-IS3050CW/CA-IS3052CW

Note: JEDEC specification is designed to also qualify a family of similar components utilizing the same fabrication process, design rules, and similar circuits. The family qualification may also be applied to a package family where the construction is the same and only the size and number of leads differs.
